

# Informs and Protects

Asset Management has been necessary ever since early man gained a first simple understanding of wealth. The importance of knowing and protecting assets has been understood ever since.

Assets move with the times - and so must asset management.

## Manage IT and non-IT Assets

WiNAiM™ is an integrated, crawler-based asset management solution for managing today's most dynamic and vulnerable asset – the IT network. It also provides an elegantly simple interface to ensure that all non-IT assets can be managed within the same program, in user-definable ways designed to suit every type of organisation and business enterprise.

## Minimise Risk

Management of IT assets has become increasingly difficult as products become more compact, powerful and mobile. Greater autonomy for staff at all levels over purchasing and deployment is another growing complication many companies are facing, as are downloadable software solutions which raise licensing and compliance issues.

IT infrastructures are dynamic – creating situations which require effective management on a constant day-to-day basis in order to maintain control, ensure an accurate knowledge base for implementation and decisionmaking and to minimise risk.

## Maximise Knowledge

WiNAiM™ addresses all the challenges and difficulties of identification, tracking and auditing – a process which has become complex, intrusive on management time and therefore expensive.

The effective management of both IT and non-IT assets calls for automatic and intelligent solutions which are cost-effective and adaptable.

## Advanced Solution

WiNAiM™ is a web-based solution developed on Microsoft .NET and deployable over IIS web servers. This is a multi-user system with built-in role-based authentication, running on MS SQL server database.

## Feature Rich

Key features of WinAiM Intelligent Asset Management include: -

- Asset classification with unique identification of each asset
- Reference documentation
- Complete IT hardware inventory covering computer, CPU, hard-disk and peripherals, memory and connected devices
- Lists all installed software packages
- Provides scheduled and ad-hoc asset management audits
- Life cycle management – installation, deployment, movements, repairs, maintenance, hire and return reminders, disposal and warranty renewal
- Product Exception Report showing new and 'missing' software
- Stores license information for master reference and identifies and locates unlicensed/uncustomised software
- Tracks licenses by consolidating audit findings
- Searches assets by user-defined criteria (e.g. PCs/1GB RAM running XP)
- Fully-automated network scanning - requires no clientside software installation
- Facilitates handling of non-IT assets
- Automatic domain detector and password management by or individual domain
- Dynamic report builder for generating user-defined reports
- Provides exceptional support for disaster recovery – from IT events and fire/flood/theft

## Comprehensive Reporting

- Asset inventory by type of assets and location
- Deployment spread across organization
- Installation details of software with timestamp
- Tracking versions of upgrades/patches
- License usage using master license and installed incidents, also comparison with CAL, wherever applicable
- Summary reports by location, department, custodian and category

## Best Practice

WinAiM™ is aimed at productivity improvement while ensuring best practice is followed in each of the processes. It has evolved through a combination of technical expertise (eg crawler technology) and a detailed analysis of end-user perspectives. It is ideal and cost-effective for any organisation looking for comprehensive management of both IT and non-IT assets.
